

The screenshot shows a VS Code editor with a Python project named 'HealthcareProject'. The Explorer sidebar on the left lists the project files, including 'train_model_hfmd.py', 'main.py', 'backend', 'database.py', 'env', 'ml_model12.py', 'requirements.txt', 'test_gradcam.py', 'test_ml.py', 'train_model_hfmd.py', 'train_model.py', 'twilio_whatsapp.py', 'BoneFracturesDetection', 'OUTLINE', and 'TIMELINE'. The main editor displays the code for 'train_model_hfmd.py', which includes imports for 'keras', 'tensorflow', and 'numpy', and defines a model architecture. A Windows PowerShell terminal window is open in the foreground, showing the output of the training process, including accuracy, confusion matrix, and breakdown metrics. The bottom status bar indicates the current file is 'train_model_hfmd.py', line 35, column 72.

WHAT IS THE PERCENTAGE OF PROBABILITY THIS
PATIENT HAD WHEN DETECTING NORMAL SCAN

Based on the patient history provided, it appears that there are multiple results indicating a fracture with high probabilities (ranging from 0.931 to 0.996). However, one result shows a normal scan with a probability of 0.258. To answer your question, the percentage of probability when detecting a normal scan is: 0.25884616 This represents approximately 25.9% likelihood that the patient's scan was normal on the given date and time (2026-05-06 12:46:34).

THANKS THAT SOUNDS GOOD, ALL THE OTHER SCANS
WERE FRACTURES?

Based on the patient history provided, it appears that all of the scans except one have resulted in a fracture diagnosis with high probability values ranging from 0.931 to 0.996. The only exception is the scan dated 2026-05-06 12:46:34.073384, which had a fracture probability of 0.258, indicating that it was unlikely to be a fracture. In summary, yes, all scans except one have been diagnosed as fractures.
