WHAT IS THE PERCENTAGE OF PROBABILITY THE
PATIENT HAD WHEN DETECTING NORMAL SCAN

Based on the patient history provided, it appears that there are multiple results indicating a fracture with high probabilities (ranging from 0.931 to 0.996). However, one result shows a normal scan with a probability of 0.258. To answer your question, the percentage of probability when detecting a normal scan is: 0.25884616 This represents approximately 25.9% likelihood that the patient's scan was normal on the given date and time (2026-05-06 12:46:34).

THANKS THAT SOUNDS GOOD, ALL THE OTHER SCANS
WERE FRACTURES?

Based on the patient history provided, it appears that all of the scans except one have resulted in a fracture diagnosis with high probability values ranging from 0.931 to 0.996. The only exception is the scan dated 2026-05-06 12:46:34.073384, which had a fracture probability of 0.258, indicating that it was unlikely to be a fracture. In summary, yes, all scans except one have been diagnosed as fractures.
